1 Question 1:

1.1 Sketch the region in the complex plane determined by the inequality

• |z-4| > 3|z+4|

 $\bullet \ \ \{z \in \mathbb{C}: |2z-1| < 2|2z-i|\} \\ \underline{2022 \ \mathrm{Q1(a)}, \ 2021 \ \mathrm{Q1(d)}, \ 2017 \ \mathrm{Q1(a)}, \ 2016 \ \mathrm{Q1(a)}}$

1.2 Determine all solutions to roots of unity

• $z^6 - 1 = 0$ and factorize $x^6 - 1$ as a product of linear and quadratic factors $\underline{2023 \text{ Q1(b)}}, \underline{2021 \text{ Q1(c)}}$

• $z^4 = -81i$ and find a polynomial p(z) with complex coefficients with root w and $p(\overline{w}) \neq 0$ 2022 Q1(b),2018 Q1(b)

1.3 Determine and sketch the image under the mapping

• $w = e^z$, $\{z \in \mathbb{C} : \pi/4 \le \text{Im}(z) \le \pi/2\}$ $\underline{2023 \text{ Q1(c)}, 2021 \text{ Q1(a)}, 2017 \text{ Q1(d)}}$

• $w = \text{Log}(z), \{z : |z| > 1, 0 \le \text{Arg}(z) \le \pi/2\}$ 2022 Q1(d), 2018 Q1(d), 2016 Q1(d)

1.4 Find z where the function is 0

• $\cos(z) = \frac{e^{iz} + e^{-iz}}{2}$

1.5 Calculate principal value Log(z)

• $z = -\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}i$ and prove e^z is the inverse function of Log(z) $\underline{2022 \text{ Q1(c)}}, 2018 \text{ Q1(c)}, 2017 \text{ Q1(c)}$

1.6 Prove the following

• Define the complex conjugate (\overline{w}) and prove if w is a zero of a polynomial $p(z) = a_0 + a_1 z + \ldots + a_n z^n$ then \overline{w} is also a zero of p(z) $\underline{2021 \text{ Q1(b)}, 2018 \text{ Q1(a)}, 2016 \text{ Q1(b)}}$

• Define the complex exponential function e^z and prove Eulers Formula $e^{i\theta} = \cos(\theta) + i\sin(\theta)$ 2017 Q1(b)

2 Question 2:

2.1 Determine image of the line

- $f(z) = \frac{1}{z}$ { $z \in \mathbb{C} : \text{Re}(z) = 2$ } 2023 Q2(a), 2021 Q2(b)
- $f(z) = \frac{1}{z}$ { $z \in \mathbb{C} : \text{Re}(z) = 1$ } 2022 Q2(a), 2018 Q2(a), 2017 Q2(a)

2.2 State and Use Cauchy-Riemann Equations

- State CRE, and use to prove $f(z) = \frac{1}{z}$ is holomorphic on $\mathbb{C}\setminus\{0\}$ 2023 Q2(a)
- State CRE, and use to prove $f(z)=z^2$ is holomoprhic on $\mathbb C$ 2022 Q2(b)
- State CRE. Let f = u + iv be holomoprhic on $\Omega \subset \mathbb{C}$. Prove ∇u and ∇v are perpendicular of equal length 2016 Q2(b)

2.3 Show that

- If $\overline{f(z)} = f(\overline{z})$ for all $z \in \mathbb{C}$ then f(x) is real for all $x \in \mathbb{R}$. And if in addition f is holomorphic at $x \in \mathbb{R}$ then f'(x) is real.
- Define that is meant for a function g to be harmonic. If f=u+iv is holomorphic on $\Omega\subset\mathbb{C}$, prove that v(x,y) is a harmonic function, and that ∇u and ∇v are perpendicular of equal length. 2022 Q2(c), 2018 Q2(b)
- If $\overline{f(z)} = f(\overline{z})$ for all $z \in \mathbb{C}$ then f(x) is real for all $x \in \mathbb{R}$. And if in addition f is holomorphic at 0 then the function f'(0) is real.
- Let f(z) = u + iv be holomorphic on an open subset Ω of the complex plane and let h(u, v) be a harmonic function of u and v on $f(\Omega)$. Prove that g(x, y) = h(u(x, y), v(x, y)) is harmonic on Ω (You may assume $\nabla u, \nabla v$ are equal length and perpendicular)
- Define what is meant for a function f(z) to be holomorphic at a point $z_0 \in \mathbb{C}$ and prove that $f(z) = z^2$ is holomorphic and find its derivative there. Hence prove that the product uv is harmonic where f = u + iv 2018 Q2(c)
- Define what is meant for a function f(z) to be holomorphic at a point $z_0 \in \mathbb{C}$ and prove that $f(z) = \frac{1}{z}$ is holomorphic on $\mathbb{C}\setminus 0$ and find its derivative there (State any theorems used)
- Let h(u,v) be a harmonic function of u,v on $f(\Omega)$ (See 2016 Q2(b)). Prove that g(x,y)=h(u(x,y),v(x,y)) is harmonic on Ω

2.4 Find Mobius Transformation

- $T(z): (-1,1,\infty) \mapsto (-1,-i,1)$ 2023 Q2(d)
- $T(z):(2,1,-1)\mapsto (1,0,\infty)$ 2022 Q2(d)
- $T(z): (-i, -1, 1) \mapsto (1, 0, \infty)$ and find the inverse Mobius Transformation 2021 Q2(d)
- $T(z): (-i, -1, i) \mapsto (1, 0, \infty)$ and find the inverse Mobius Transformation 2018 Q2(d), 2017 Q2(d)
- $T(z): (-1, \frac{1}{2}, 2) \mapsto (1, 0, \infty)$ and find the inverse Mobius Transformation 2016 Q2(d)

3 Worked Examples - Q1

Example 3.1: 2023 Q1(a)

Given |z-4| > 3|z+4|Write z = x + iy

$$|x + iy - 4| > 3|x + iy + 4|$$

$$|(x - 4) + iy| > 3|(x + 4) + iy|$$

$$\sqrt{(x - 4)^2 + y^2} > 3\sqrt{(x + 4)^2 + y^2}$$

Square both sides

$$(x-4)^2 + y^2 > 9((x+4)^2 + y^2)$$

$$(x^2 - 8x + 16 + y^2) > 9x^2 + 72x + 144 + 9y^2$$

$$x^2 - 8x + 16 + y^2 - 9x^2 - 72x - 144 - 9y^2 > 0$$

$$-8x^2 - 80x - 8y^2 - 128 > 0$$

$$x^2 + 10x + y^2 - 16 < 0$$

Moving all terms to one side
Simplify

Dividing by -8 and reversing inequality

Focus on x and complete the square

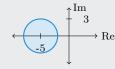

$$x + bx = \left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2 \Rightarrow x^2 + 10x = (x+5)^2 - 25$$
$$(x+5)^2 - 25 + y^2 + 16 < 0$$
$$(x+5)^2 + y^2 + 9 < 0$$
$$(x+5)^2 + y^2 < -9$$

Complete the square
Substitute back into inequality
Simplify
Subtract 9

Recall the eqation of a circle

$$(x-a)^2 + (y-b)^2 = r^2 \Rightarrow (x+5)^2 + y^2 < -9$$

Therefore the region is all the points inside circle with radius 3 and center at (-5, 0)

Example 3.2: 2022 Q1(a), 2021 Q1(d), 2017 Q1(a), 2016 Q1(a)

Given
$$\{z \in \mathbb{C} : |2z - 1| < 2|2z - i|\}$$

Write $z = x + iy$

$$\begin{aligned} |2x+i2y-1| &< 2|2x+i2y-i| \\ |(2x-1)+i2y| &< 2|2x+i(2y-1)| \\ \sqrt{(2x-1)^2+4y^2} &< 2\sqrt{4x^2+(2y-1)^2} \\ (2x-1)^2+4y^2 &< 4[4x^2+(2y-1)^2] \\ 4x^2-4x+1+4y^2 &< 16x^2+16y^2-16y+4 \\ -12x^2-4x-12y^2+16y-3 &< 0 \\ 12x^2+4x+12y^2-16y+3 &> 0 \\ x^2+\frac{1}{3}x+y^2-\frac{4}{3}y+\frac{1}{4} &> 0 \end{aligned}$$

 $Square\ both\ sides$ Expand $Move\ all\ terms\ to\ one\ side$ Multiply by -1 and reverse inequality

Divide by 12

Complete square for x

$$x^{2} + bx = \left(x + \frac{b}{2}\right)^{2} - \left(\frac{b}{2}\right)^{2} \Rightarrow x^{2} + \frac{1}{3}x = \left(x + \frac{1}{6}\right)^{2} - \left(\frac{1}{36}\right)^{2}$$

Complete square for y

$$y^2 + by = \left(y - \frac{2}{3}\right)^2 - \left(\frac{4}{9}\right)$$

Substitute back into inequality

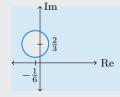

$$\left(x + \frac{1}{6}\right)^2 - \left(\frac{1}{36}\right) + \left(y - \frac{2}{3}\right)^2 - \left(\frac{4}{9}\right) + \frac{1}{4} > 0$$
Substitute back into inequality
$$\left(x + \frac{1}{6}\right)^2 + \left(y - \frac{2}{3}\right)^2 > \frac{2}{9}$$
Simplify and move constant across

Substitute back into inequality

Recall the eqation of a circle

$$(x-a)^2 + (y-b)^2 = r^2 \Rightarrow \left(x + \frac{1}{6}\right)^2 + \left(y - \frac{2}{3}\right)^2 < \frac{2}{9}$$

Therefore the region is all the points $\overline{\text{OUTSIDE}}$ the circle with radius $\frac{\sqrt{2}}{3}$ and center at $(-\frac{1}{6},\frac{2}{3})$

Given
$$z^6-1=0$$

Write $z=e^{i\theta}$ and $1=e^{i2\pi k}$ for $k\in\mathbb{Z}$

$$z^{6} - 1 = 0$$

$$e^{i6\theta} - e^{i2\pi k} = 0$$

$$e^{i6\theta} = e^{i2\pi k}$$

$$6\theta = 2\pi k$$

$$\theta = \frac{\pi k}{3}$$

Therefore the solutions are

$$z=e^{i\theta}=e^{i\frac{\pi k}{3}}=\cos\left(\frac{\pi k}{3}\right)+i\sin\left(\frac{\pi k}{3}\right)\quad\text{for}\quad k=0,1,2,3,4,5$$

$$k = 0: w_0 = \cos(0) + i\sin(0) = 1 + i0$$

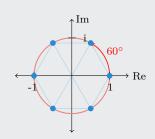

$$k = 1: w_1 = \cos\left(\frac{\pi}{3}\right) + i\sin\left(\frac{\pi}{3}\right) = \frac{1}{2} + i\frac{\sqrt{3}}{2}$$

$$k = 2: w_2 = \cos\left(\frac{2\pi}{3}\right) + i\sin\left(\frac{2\pi}{3}\right) = -\frac{1}{2} + i\frac{\sqrt{3}}{2}$$

$$k = 3: w_3 = \cos(\pi) + i\sin(\pi) = -1$$

$$k = 4: w_4 = \cos\left(\frac{4\pi}{3}\right) + i\sin\left(\frac{4\pi}{3}\right) = -\frac{1}{2} - i\frac{\sqrt{3}}{2}$$

$$k = 5: w_5 = \cos\left(\frac{5\pi}{3}\right) + i\sin\left(\frac{5\pi}{3}\right) = \frac{1}{2} - i\frac{\sqrt{3}}{2}$$

We can write:

$$x^{6} - 1 = (x - w_{0})(x - w_{1})(x - w_{2})(x - w_{3})(x - w_{4})(x - w_{5})$$

Rewriting to group complex conjugates

$$x^{6} - 1 = (z - w_{0})(z - w_{3}) \cdot (z - w_{1})(z - w_{5}) \cdot (z - w_{2})(z - w_{4})$$

Note that

$$(w-z)(w-\overline{z}) = w^2 - w\overline{z} - zw + z\overline{z}$$
$$= w^2 - 2(\overline{z}+z) + 1$$

We recall that

$$z = x + iy = e^{i\theta} = \cos(\theta) + i\sin(\theta)$$
$$\overline{z} = x - iy = e^{-i\theta} = \cos(\theta) - i\sin(\theta)$$

Then

$$\overline{z} + z = \cos(\theta) + i\sin(\theta) + \cos(\theta) - i\sin(\theta)$$
$$= 2\cos(\theta)$$

Thus

$$(w-z)(w-\overline{z}) = w^2 - 2\cos(\theta) + 1$$

We see that $-\frac{5\pi}{3} = \frac{\pi}{3} - 2\pi$, thus:

We see that
$$-\frac{4\pi}{3} = \frac{\pi}{3} - \pi$$
, thus:

$$(z - w_1)(z - w_5) = (z - e^{i\frac{\pi}{3}})(z - e^{i\frac{5\pi}{3}})$$

$$(z - w_1)(z - w_5) = z^2 - 2\cos\left(\frac{\pi}{3}\right) + 1$$

$$(z - w_1)(z - w_5) = z^2 + z + 1$$

$$(z - w_2)(z - w_4) = (z - e^{i\frac{2\pi}{3}})(z - e^{i\frac{4\pi}{3}})$$

$$(z - w_2)(z - w_4) = z^2 - 2\cos\left(\frac{2\pi}{3}\right) + 1$$

$$(z - w_2)(z - w_4) = z^2 - z + 1$$

Therefore

$$x^{6} - 1 = (x+1)(x-1)(x^{2} + x + 1)(x^{2} - x + 1)$$

Given
$$z^4 = -81i$$
, we want to find $z^{4\left(\frac{1}{4}\right)} = w$

Recall:

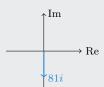

$$z^{1/n} = R^{1/n} [\cos \phi + i \sin \phi]$$
 with $\phi = \frac{\theta + 2k\pi}{n}$, $k \in (0, 1, 2, \dots, n-1)$ and $R = |z|$

Thus

$$R = |81i| = \sqrt{0^2 + 81^2} = 81$$

$$\theta = -\frac{\pi}{2}$$

$$\phi = \frac{\theta + 2k\pi}{n} = \frac{-\frac{\pi}{2} + 2k\pi}{4} = \frac{-\pi}{8} + \frac{k\pi}{2}$$

Therefore

$$\begin{split} w_k &= 81^{1/4} \left[\cos \left(\frac{-\pi}{8} + \frac{k\pi}{2} \right) + i \sin \left(\frac{-\pi}{8} + \frac{k\pi}{2} \right) \right] \quad k \in (0, 1, 2, 3) \\ w_0 &= 3 \left[\cos \left(\frac{-\pi}{8} \right) + i \sin \left(\frac{-\pi}{8} \right) \right] \approx 2.77 - 1.155i \\ w_1 &= 3 \left[\cos \left(-\frac{\pi}{8} + \frac{\pi}{2} \right) + i \sin \left(-\frac{\pi}{8} + \frac{\pi}{2} \right) \right] \approx 1.155 + 2.77i \\ w_2 &= 3 \left[\cos \left(-\frac{\pi}{8} + \pi \right) + i \sin \left(-\frac{\pi}{8} + \pi \right) \right] \approx -1.55 + 2.77i \\ w_3 &= 3 \left[\cos \left(-\frac{\pi}{8} + \frac{3\pi}{2} \right) + i \sin \left(-\frac{\pi}{8} + \frac{3\pi}{2} \right) \right] \approx -2.77 - 1.55i \end{split}$$

Part 2:

Given p(z) with complex coefficients has root w and $p(\overline{w}) \neq 0$ In other words, we want p(w) = 0 and $p(\overline{w}) \neq 0$

Using the most simple polynomial, p(z) = z - w and letting $w = 3e^{i\frac{-\pi}{8}}$ we have

$$p(z) = z - 3e^{i\frac{-\pi}{8}}$$

$$p(w) = w - w$$
= $3e^{i\frac{-\pi}{8}} - 3e^{i\frac{-\pi}{8}}$

$$\begin{split} p(\overline{w}) &= \overline{w} - 3e^{i\frac{-\pi}{8}} \\ &= 3e^{-i\frac{\pi}{8}} - 3e^{i\frac{-\pi}{8}} \\ &= 3\left[\cos\left(\frac{\pi}{8}\right) - i\sin\left(\frac{\pi}{8}\right) - \left(\cos\left(\frac{\pi}{8}\right) + i\sin\left(\frac{\pi}{8}\right)\right)\right] \\ &= 3\left[\cos\left(\frac{\pi}{8}\right) - i\sin\left(\frac{\pi}{8}\right) - \cos\left(\frac{\pi}{8}\right) - i\sin\left(\frac{\pi}{8}\right)\right] \\ &= 3\left[-2i\sin\left(\frac{\pi}{8}\right)\right] \\ &= -6i\sin\left(\frac{\pi}{8}\right) \\ &\approx -2.3i \neq 0 \end{split}$$

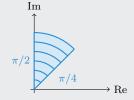

Example 3.5: Determine and sketch the image under the map $w=e^z$, $\{z\in\mathbb{C}:\pi/4\leq \mathrm{Im}(z)\leq\pi/2\}$

$$w = e^z = e^{x+iy}$$
$$= e^x e^{iy}$$
$$= e^x [\cos(y) + i \sin(y)]$$

Recall the polar form of a complex number $z = |z|[\cos(\theta) + i\sin(\theta)]$

We see, e^x acts as the radius, and is always positive, and $[\cos(y) + i\sin(y)]$ acts draws out a section of the unit circle, thus the mapping $w = e^z$ sends the set to:

$$\left\{w \in \mathbb{C} : |w| > 0, \frac{\pi}{4} \le \arg(w) \le \frac{\pi}{2}\right\}$$

Example 3.6: Determine and sketch the region $w = \text{Log}(z), \{z : |z| > 1, 0 \le \text{Arg}(z) \le \pi/2\}$

$$w = \operatorname{Log}(z) = \ln|z| + i \operatorname{Arg}(z) = u + iv$$

Note that |z|>1 implies $\ln|z|>0$ Thus:

$$\left\{w=u+iv\in\mathbb{C}:u>0,0\leq v\leq\frac{\pi}{2}\right\}$$

Example 3.7: Find where the function is 0: $\cos(z) = \frac{e^{iz} + e^{-iz}}{2}$

We want $\cos(z) = \frac{e^{iz} + e^{-iz}}{2} = 0$, some basic algebra gives us:

$$\begin{aligned} \cos(z) &= \frac{e^{iz} + e^{-iz}}{2} = 0 \\ e^{iz} + e^{-iz} &= 0 \\ e^{iz} &= -e^{-iz} \\ e^{iz} \cdot e^{iz} &= -e^{-iz} \cdot e^{iz} \\ e^{2iz} &= -e^0 \end{aligned} \qquad \qquad \begin{aligned} &Multiply \ both \ sides \ by \ e^{iz} \\ &e^{a} \cdot e^{b} = e^{a+b} \\ &e^{2iz} &= -1 \end{aligned}$$

Recall:

$$-1 = \cos(\pi + 2\pi k) + i\sin(\pi + 2\pi k) = e^{i(\pi + 2\pi k)}$$

Thus

$$\begin{array}{ll} e^{2iz}=e^{i(\pi+2\pi k)} \\ 2iz=i(\pi+2\pi k) & \textit{Taking the natural log of both sides} \\ 2z=\pi+2\pi k & \textit{Divide by 2} \\ z=\frac{\pi}{2}+\pi k & \textit{Divide by i} \end{array}$$

Therefore, the zeros of $\cos(z)$ are:

$$z = \frac{\pi}{2} + \pi k, \quad k \in \mathbb{Z}$$

9

Example 3.8: Calculate the principal value Log(z) of $z=-\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}}i$ and prove e^z is the inverse function of Log(z)

Part 1. Given
$$z = -\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}i$$
:

$$\ln|z| = \sqrt{(1/\sqrt{2})^2 + (1/\sqrt{2})^2} = 1$$

and

$$Arg(z) = \tan^{-1}(-1)$$
$$= -\tan^{-1}(1)$$
$$= -\frac{\pi}{4} \Rightarrow \frac{3\pi}{4}$$

Therefore

Part 2: We need to show that (a) $e^{\text{Log}(z)} = z$ and (b) $\text{Log}(e^z) = z$ (a) Let $z = |z|e^{i\theta}, |z| > 0$ and $\theta = \text{Arg}(z)$

$$\begin{aligned} \operatorname{Log}(z) &= \ln |z| + i\theta \\ e^{\operatorname{Log}(z)} &= e^{\ln |z| + i\theta} \\ &= e^{\ln |z|} \cdot e^{i\theta} \\ &= |z| \cdot e^{i\theta} \\ e^{\operatorname{Log}(z)} &= z \end{aligned}$$

Exponentiate both sides

 $Exponentiation\ rules$

(b) Let
$$z = x + iy, y \in [-\pi, \pi]$$

$$e^{z} = e^{x+iy}$$

$$= e^{x} \cdot e^{iy}$$

$$\operatorname{Log}(e^{z}) = \ln|e^{x} \cdot e^{iy}|$$

$$= \ln|e^{x}| + \ln|e^{iy}|$$

$$= x + iy$$

 $Log(e^z) = z$

Take log of both sides

 $\log(a \cdot b) = \log(a) + \log(b)$

Example 3.9: Define the complex conjugate (\overline{w}) and prove if w is a zero of a polynomial $p(z) = a_0 + a_1 z + \ldots + a_n z^n$ then

Definition: For a complex number w=a+bi the complex conjugate of w is defined as $\overline{w}=a-bi$ (with $a,b\in\mathbb{R}$

and $i = \sqrt{-1}$) This has several properties:

$$\overline{z+w} = \overline{z} + \overline{w}$$

$$\overline{zw} = \overline{z} \cdot \overline{w}$$

$$\overline{(w^n)} = (\overline{w})^n$$

Proof: If w is zero of a polynomial $p(z) = a_0 + a_1 z + \ldots + a_n z^n$ then $p(\overline{w}) = 0$

Assume $p(w) = a_0 + a_1 w + ... + a_n w^n = 0$

Take the conjugate of both sides $\overline{p(w)} = \overline{0} = 0$

Evalute
$$p(\overline{w}) = a_0 + a_1 \overline{w} + \dots + a_n \overline{w}^n$$

 $= a_0 + a_1 \overline{w} + \dots + a_n \overline{w}^n$
 $= \overline{a_0} + \overline{a_1 w} + \dots + \overline{a_n w^n}$
 $= \overline{a_0 + a_1 w + \dots + a_n w^n}$

 $=\overline{p(w)}=0$

Thus, since we assumed p(w) = 0:

$$p(\overline{w}) = \overline{p(w)} = 0$$

Example 3.10: Define the complex exponential function e^z and prove Eulers Foruma $e^{i\theta} = \cos(\theta) + i\sin\theta$

Defition: For any $z \in mathbbC$, e^z is defined by its power series:

$$e^z = \sum_{n=0}^{\infty} \frac{z^n}{n!}$$

The series converges for all $z \in \mathbb{C}$ and has the following properties:

$$e^{z_1 + z_2} = e^{z_1} \cdot e^{z_2}$$

$$e^z \cdot e^{-z} = 1$$

Proof of Eulers Formula

Eulers Formula $e^{i\theta} = \cos(\theta) + i\sin(\theta)$

$$e^{i\theta} = \sum_{n=0}^{\infty} \frac{(i\theta)^n}{n!}$$

$$= \sum_{n=0}^{\infty} \frac{(i\theta)^{2n}}{(2n)!} + \sum_{n=0}^{\infty} \frac{(i\theta)^{2n+1}}{(2n+1)!}$$

$$= \sum_{n=0}^{\infty} \frac{(i)^{2n}(\theta)^{2n}}{(2n)!} + \sum_{n=0}^{\infty} \frac{(i)^{2n+1}(\theta)^{2n+1}}{(2n+1)!}$$

Substitute $z = i\theta$

Split into even and odd powers

Seperate powers

We note that:

$$i^{2n} = (i^2)^n = (-1)^n$$

 $i^{2n+1} = i \cdot i^{2n} = i(-1)^n$

Thus:

$$e^{i\theta} = \sum_{n=0}^{\infty} \frac{(-1)^n (\theta)^{2n}}{(2n)!} + \sum_{n=0}^{\infty} \frac{i(-1)^n (\theta)^{2n+1}}{(2n+1)!}$$
$$= \sum_{n=0}^{\infty} \frac{(-1)^n (\theta)^{2n}}{(2n)!} + i \sum_{n=0}^{\infty} \frac{(-1)^n (\theta)^{2n+1}}{(2n+1)!}$$
$$:= \cos(\theta) + i \sin(\theta)$$

4 Worked Examples - Q2

Example 4.1: Determine the image of the line $f(z) = \frac{1}{z}$ $\{z \in \mathbb{C} : \text{Re}(z) = 2\}$

Let

$$w = f(z) = \frac{1}{z}$$

Then we have:

$$w = \frac{1}{z}$$
, so that $zw = 1 \implies z = \frac{1}{w}$,

$$z = \frac{1}{u + iv} = \frac{u - iv}{(u + iv)(u - iv)} = \frac{u - iv}{u^2 + v^2} = \frac{u}{u^2 + v^2} - i\frac{v}{u^2 + v^2}$$

We note that: $Re(z) = \frac{u}{u^2 + v^2} = a$

$$u = a(u^{2} + v^{2})$$
 \Rightarrow $\frac{1}{a}u = u^{2} + v^{2}$ $\Rightarrow u^{2} - \frac{1}{a}u + v^{2} = 0$

Completing the square in u:

$$\left(u^2 - \frac{1}{2a}\right)^2 - \frac{1}{4a^2} + av^2 = 0 \Rightarrow \left(u^2 - \frac{1}{2a}\right)^2 + av^2 = \frac{1}{4a^2}$$

Letting a=2:

$$\left(u^2 - \frac{1}{4}\right)^2 + 4v^2 = \frac{1}{16}$$

 $\stackrel{\text{Im}}{\xrightarrow{1/4\pi}} \text{Re}$

Thus the image is sphere with radius $\frac{1}{4}$ and centre $(\frac{1}{4},0)$

Example 4.2: Determine the image of the line $f(z) = \frac{1}{z}$ $\{z \in \mathbb{C} : \text{Re}(z) = 1\}$

Let:

$$w = f(z) = \frac{1}{z}$$

Then we have:

$$w = \frac{1}{z}$$
, so that $zw = 1 \Rightarrow z = \frac{1}{w}$,
 $z = \frac{1}{u + iv} = \frac{u - iv}{(u + iv)(u - iv)} = \frac{u - iv}{u^2 + v^2} = \frac{u}{u^2 + v^2} - i\frac{v}{u^2 + v^2}$

We note that: $\operatorname{Re}(z) = \frac{u}{u^2 + v^2} = a$

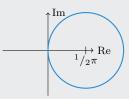

$$u = a(u^{2} + v^{2})$$
 \Rightarrow $\frac{1}{a}u = u^{2} + v^{2}$ $\Rightarrow u^{2} - \frac{1}{a}u + v^{2} = 0$

Completing the square in u:

$$\left(u^2 - \frac{1}{2a}\right)^2 - \frac{1}{4a^2} + av^2 = 0 \Rightarrow \left(u^2 - \frac{1}{2a}\right)^2 + av^2 = \frac{1}{4a^2}$$

Letting a = 1:

$$\left(u^2 - \frac{1}{2}\right)^2 + v^2 = \frac{1}{4}$$

Thus the image is sphere with radius $\frac{1}{2}$ and centre $(\frac{1}{2},0)$
