1 Systems of linear equations

1.1 Linear equations and Solution Sets

A linear equation in the variables x and y is an equation of the form

$$2x + y = 3$$

If we replace x and y with some numbers, the statement **becomes true or false**.

Definition 1.1: Solution to a linear equation

A pair, $(x_0, y_0) \in \mathbb{R}$, is a solution to an linear equation if setting $x = x_0$ and $y = y_0$ makes the equation true.

The solution set is the set of all solutions to a linear equation.

Definition 1.2: Solution set

The solution set of the linear equation

$$a_1X_1 + a_2X_2 + \ldots + a_nX_n = b$$
 where $a_i, b \in \mathbb{R}$

is an **affine hyperplane** in \mathbb{R}^n ; geometrically resembles a copy of \mathbb{R}^{n-1} inside \mathbb{R}^n .

1.2 Elementary Row Operations

To solve a system of linear equations we associate an **augmented matrix** to the system of equations. For example:

To solve, we can perform the following **Elementary Row Operations (EROs)**:

Definition 1.3: Elementary Row Operations

- 1. Multiply a row by a non-zero constant.
- 2. Add a multiple of one row to another row.
- 3. Swap two rows.

The goal of these operations is to transform the augmented matrix into **row echelon form** (REF) or **reduced row echelon form** (RREF).

1.2.1 REF and Strategy

Definition 1.4: Row Echelon Form

- The first non zero entry in each row is a 1 (called the **leading 1**).
- If a column has a leading 1, then all entries below it are 0.
- The leading 1 in each row is to the right of the leading 1 in the previous row.
- All rows of 0s are at the bottom of the matrix.

Example:

$$\begin{bmatrix} 1 & 2 & -1 & | & 3 \\ 0 & 1 & 2 & | & -1 \\ 0 & 0 & 1 & | & -1 \end{bmatrix}$$

3

We have produced a new system of equations. This is easily solved by back substitution.
